REFERENCE LETTER

The Ķīvītes landfill is located in Grobiņa, near Liepāja. We manage an average of 40 000 t of municipal waste a year, which comes to us from all over the region.

For a long time, our company faced a number of problems, such as spread of light fractions of waste, polythene bags, and odours coming from the landfill. Given the small size of our landfill, it was essential to minimise the working face area.

Cooperation with SIA RSGA provided us with a solution to these issues. The Alternative Daily Coverage reduced the spread of bags and other light fractions, strengthened the slopes and reduced their erosion. Also, compared to the commonly used daily coverage, usually earth or sand, this Alternative Daily Coverage is many times thinner, which reduces the volume of the working face, while the application is quick and does not require spending our resources on bringing and spreading bulky waste covering materials.

We can recommend SIA RSGA both as an Alternative Daily Coverage service provider and as a reliable business partner, who helped us find solutions to our landfill problems.

Yours faithfully,

SIA Liepājas RAS
